Proposal requirements:

Submission: A single PDF document, which includes a pointer to your GitHub repo. Page length expected is ~5 pages (normal spacing/font sizes) EXCLUDING references (which have unlimited length)

Write a document summarizing what others have done related to your project for your literature review. That is, are there existing models, simulators, or simulation techniques? Will you adopt one of these approaches as a basis for your project?

What will you do that will be new or different from what you've found? You don't have to do completely new research. Still, if you are attempting to replicate an existing simulator or simulation study, you should distinguish what you will attempt to do from what has been done before.

Include a clear and detailed description of your project. At this stage, you should have a clearer idea of the project, and the details you expect will be part of the final submission.

So, include the things above in concert with:

a) An abstract summarizing the system and the goals of the project

b) Description of the system being studied

c) A conceptual model of the system

d) Platform(s) / modalities of development

e) Literature review
